

Press release December 16, 2021:

Nordic Appeal from 11 NGO's – calling for better protection against wireless technology

In a joint letter, representatives from 11 Nordic organizations from 4 European countries, active in the field of health risks from radiation from wireless technology, request that humans and the environment must be better protected.

People's exposure to pulsed microwave radiation from wireless technology has increased exponentially in recent years, mainly due to the expansion of 4G+ and 5G and an increased amount of consumer products based on technology that emits microwave radiation.

In the Nordic countries, outdated rules for permitted radiation are still applied, which only protect people against harmful effects that occur as a result of acute heating. This means that **humans are completely unprotected** against the amount of harmful effects, such as cancer, DNA damage, oxidative stress and neurological effects, that research has repeatedly shown to occur at levels well below these reference values. Current reference values also have no protection against harmful effects on biodiversity.

The organizations note that they are constantly reached by new testimonies from people who have suffered from ill health after base stations for 4G, 5G or smart electricity meters have been installed in their immediate environment, and that the development is very worrying.

The Nordic Appeal call for 4 important measures to be taken.
